Ig kappa chain precursor V-J-C region (LS1) - human (fragment)
C;Species: Homo saplens (man)
C;Species: Homo saplens (man)
C;Accession: PLO106
C;Accession: PLO106
R;Silberstein, L.E.; Litwin, S.; Carmack, C.E.
J. Exp. Med. 169, 1631-1643, 1989
A;Title: Relationship of variable region genes expressed by a human B cell lymphoma secr.
A;Reference number: PLO106; MUID:89235583; PMID:2541221
A;Accession: PLO106
A;Molecule type: mRNA
A;Residues: 1-144 <SIL>
C;Superfamily: immunoglobulin V region; immunoglobulin homology
C;Keywords: heterotetramer; immunoglobulin
F;1-20/Domain: signal sequence #status predicted <SIG>
F;21-115/Domain: V region <VRE>
F;36-110/Domain: immunoglobulin homology <IMM>
F;44-54/Region: complementarity-determining 1
F;70-76/Region: complementarity-determining 2
F;109-115/Region: complementarity-determining 3
F;116-127/Domain: J region <JRG>
F;118-144/Domain: C region (fragment) <CRE>
Ig kappa chain V region (17/9) - mouse (C;Species: Mus musculus (house mouse) C;Species: Mus musculus (house mouse) C;Date: 31-Mar-1990 #sequence_revision 31-Mar-1990 #text_change 21-Jan-2000 C;Accession: A31790 Rini, J.M.; Arevalo, J.; Stura, E.A.; Kenten, J.H.; W.R.Schulze-Gahmen, U.; Rini, J.M.; Arevalo, J.; Stura, E.A.; Kenten, J.H.; W.J. The invention relates to an isolated human monoclonal rabies virus neutralising antibody (virucide) derived from cDNA clones encoding the antibody heavy and light chains expressed in heterologous expression systems and purified sway from deleterious contaminants. The invention provides a fused gene encoding a chimeric immunoglobulin light chain and a fused gene encoding a chimeric immunoglobulin heavy chain. The antibody of the invention is useful for treating an individual exposed to a rabies virus by administering to the individual a therapeutically effective amount of the antibody, and preventing a spread of the rabies virus to the central nervous system (CNS). The antibody of the invention provides a safe and efficacious post exposure prophylactic therapy for individuals exposed to a rabies virus.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention discloses a recombinant antibody comprising a constant cregion of monoclonal antibody (Mab) 57 linked to a non-Mab 57 variable cregion. Rables is an acute, neurological disease caused by infection of the central nervous system with the rables virus, a member of the Lyssavirus genus of the family Rhabdowiridae. Also disclosed are methods for producing an isolated recombinant antibody by culturing a host cell, containing a recombinant expression vector comprising the nucleic acid molecule encoding the antibody, and isolating the recombinant antibody camping the recombinant antibody campitated and treating an individual exposed to a pathogen by camping to the individual the recombinant antibody. The recombinant cantibodies are useful for preventing (vaccine) and treating an individual exposed to a pathogen, e.g. rables infection. They are also useful for the gualitative and quantitative determination of the rables virus. The sequences presented are the antibody protein fragments, the nucleic acids encoding them or the PCR primers used to construct the recombinant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Matches

                                                                                                                                                                    Human bone marrow-derived serum proteins (BMDSP) 1 has chemical and structural similarity with immunoglobulin kappa light chain. BMDSP-1 and BMDSP-2 are useful for treating or preventing a disorder associated with decreased expression or activity of BMDSP.

Antagonists of BMDSP are useful for treating or preventing a disorder associated with increased expression or activity of bone marrow-derived serum proteins. The disorders include cancers (melanoma, adenocarcinoma, sarcoma), immune disorders (acquired immunodefictency syndrome (AIDS), asthma, atheroscierosis, Crohn's disease, bronchitis, multiple sclerosis, osteo- and rheumatoid arthritis), viral infections, parasitic infections (schistosoma, tapeworm), and vascular disorders (arteriosclerosis, broaterosis, coultrie).

AAH31349-AAH31428 represent cDNAs corresponding to 26 human secreted protein genes, and AAG712319 represent the proteins they encode. AAG71320-AAG71301 represent the proteins they encode. AAG71320-AAG71301 represent human secreted protein fragments. The genes and their corresponding secreted proteins are useful for preventing, treating or ameliorating medical conditions, e.g., by protein or gene therapy. Pathological conditions can be diagnosed by determining the amount of the new protein in a sample or by determining the presence of mutations in the new genes. Specific uses are described for each of the 52 genes, based on the tissues in which they are most highly expressed, and include developing products for the diagnosis or treatment of proliferative disorders, cancer, tumours, foetal and developmental abnormalities, haematopoietic disorders, diseases of the immune system, arms anteriamana discasses for rhenmatid arthritis, inflammation.

New nucleic acid molecule encoding a human secre:ed protein, usefu preventing, treating or ameliorating medical conditions such as rheumatoid arthritis, Alzheimer's disease and mirrobial infections

useful

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              gastrointestinal disorders, pregnancy-related disorders, endocrine disorders, and infections. The proteins can also be used to aid wound healing and epithelial cell proliferation, to prevent skin aging due to sunburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues, to identify their cognate ligands or binding partners, and in chemotraxis, and can be used as a food additive or preservative to modify storage properties. Antibodies specific for a protein of the invention can be used in alleviating symptoms associated with the disorders mentioned above, and in diagnostic immunoassays e.g., radioimmunoassay or enzyme linked immunosorbent assay (ELISA). The present sequence represents a human secreted protein of the invention.

The proteins are useful for treating a disease or disorder that may be modulated by therapeutic protein X. The albumin extends the shelf-life of protein X, and may increase its biological in vitro/in vivo activity. The protein is useful for treating and diagnosing disorders such as cancer, reproductive disorders, digestive disorders (e.g. Crohn's disease, ulcerative colitis), immune disorders (e.g. acquired immunodeficiency syndrome, AIDS), endocrine disorders (e.g. alzheimer's, Parkinson's, Creutzfeldt-Jacob disease, encephalomyelitis, meningitis, schizophrenia), and connective disorders (e.g. osteoporosis, arthritis).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence represents a kappa chain of an antibody of the invention. The antibody is directed cytotoxic T-lymphocyte antigen (CTLA)-4. Antibodies of the invention are composed of a heavy chain variable region, comprising a modified contiguous sequence from a FRI-FR3 sequence encoded by a human VH3-33 family gene. The modifications are contained in CDR1, CDR2 and/or framework regions. The antibodies may be used to inhibit CTLA-4 and down-regulate the lumnune system to treat hyperimmunity disorders (e.g. autoimmune disease, diabetes and graft rejection) and proliferative disorders (e.g. cancer). CTLA-4 stimulatory agents may be used to up-regulate immune system to up-regulate immunodeficient disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel antibodies capable of binding (CTLA)-4 containing specified heavy for treating, e.g. immune disorders

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence represents a kappa chain of an antibody of the invention. The antibody is directed cytotoxic T-1/mphocyte antigen (CTLA)-4. Antibodies of the invention are composed of a heavy chain variable region, comprising a modified contiguous sequence from a FR1-FR3 sequence encoded by a human VH3-33 family gene. The modifications are contained in CDR1, CDR2 and/or framework regions. The antibodies may be used to inhibit CTLA-4 and down-regulate the immune system to treat hyperimmunity disorders (e.g. autoimmune disease, diabetes and graft rejection) and proliferative disorders (e.g. cancer). CTLA-4 stimulatory agents may be used to up-regulate immune system to up-regulate immunodeficient disorders.

The antibody is useful for detecting the level of OPGL a biological sample. The antibody, or the pharmaceutical composition comprising the antibody, is also useful for treating osteopenic disords an inflammatory condition with attendant bone loss, an autoimmune condition with attendant bone loss in a partient or rheumatoid arthritis in a patient. In particular, the antibody or composition is useful for treating bone diseases, e.g. osteoporosis, bone loss from arthritis, Paget's disease, osteopenia, endocrine osteoporosis (e.g. Cushing's evadoroms or acromosals) of contents of the contents of 
  hyperimmunity proliferative

The antibodies is directed cytotoxic T-lymphocyte antigen (CTLA)-4. Antibodies of the invention are composed of a heavy chain variable region, comprising a modified contiguous sequence from a FRI-FR3 sequence encoded by a human VH3-33 family gene. The modifications are contained in CDR1, CDR2 and/or framework regions. The antibodies may be used to inhibit CTLA-4 and down-regulate the immune system to treat hyperimmunity disorders (e.g. autoimmune disease, diabetes and graft rejection) and proliferative disorders (e.g. cancer). CTLA-4 stimulatory agents may be used to up-regulate immune system to up-regulate immunodeficient disorders.

The antibody is directed cytofoxic T-lymphocyte antigen (CTLA)-4. Antibodies of the invention are composed of a heavy chain variable region, comprising a modified contiguous sequence from a FRI-FR3 sequence encoded by a human VH3-33 family gene. The modifications are contained in CDR1, CDR2 and/or framework regions. The antibodies may be used to inhibit CTLA-4 and down-regulate the immune system to treat hyperimmunity disorders (e.g. autoimmune disease, diabetes and graft rejection) and proliferative disorders (e.g. cancer). CTLA-4 stimulatory agents may be used to up-regulate immune system to up-regulate immunodeficient disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Key

Yoshida
                                                                                                                                                                                                                                                                                                                                              AAR52951 shows the light chain of a human type an:i-IgE peptide monoclonal antibody which inhibits the signal transmission for the release of chemical mediator from mast cells and basophils stimulated with allergen. The antibody can be used for the prophylaxis and the therapy of allergy.

The antibody is directed cytotoxic T-lymphocyte antigen (CTLA)-4. Antibodes of the invention are composed of a heavy chain variable region, comprising a modified contiguous sequence from a fR1-FR3 sequence encoded by a human VH3-33 family gene. The modifications are contained in CDR1, CDR2 and/or framework regions. The antibodies may be used to inhibit CTLA-4 and down-regulate the immune system to treat hyperimmunity disorders (e.g. autoimmune disease, diabetes and graft rejection) and proliferative disorders (e.g. cancer). CTLA-4 stimulatory agents may be used to up-regulate immune system to up-regulate immunodeficient disorders.

The antibody is directed cytotoxic T-lymphocyte antigen (CTLA)-4. Antibodies of the invention are composed of a heavy chain variable region, comprising a modified contiguous sequence from a FRI-FR3 sequence encoded by a human VH3-33 family gene. The modifications are contained in CDR1, CDR2 and/or framework regions. The antibodies may be used to inhibit CTLA-4 and down-regulate the immune system to treat hyperimmunity disorders (e.g. autoimmune disease, diabetes and graft rejection) and proliferative disorders (e.g. cancer). CTLA-4 stimulatory agents may be used to up-regulate immune system to up-regulate immunodeficient disorders.

                                                                                                                                                            This sequence is deduced from the cDNA clone 4B9-Vk15 and includes the amino acid sequence beyond the first stop codon. The clone is incomplete, starting from the G of the ATG initiator codon, but the initial Met is given. Antibody molecules of the invention can include one or two aberrant light chains containing a duplicated variable region, to produce heavier antibodies. These heavier antibodies were found to have higher avidity than antibodies with just a single copy of the L'V region. The antibodies can be used to treat disease, e.g. infection by Streptococcus agalactiae. They are able to pass across the placenta.

```

This sequence is deduced from the cDNA clone 4B9 Vk15 and includes the amino acid sequence beyond the first stop cocon ("x" in the sequence represents a nonsense codon). The clone is incomplete, starting from the G of the ATG initiator codon, but the initial Met

is given. Antib aberrant light

These heavier antibodies were found to have higher avidity than antibodies with just a single copy of the L'V region. The antibodies can be used to treat disease, e.g. infection by Streptococcus agalactiae. They are able to pass across the placenta.
